

INTRODUCTION TO SIMPLE HARMONIC MOTION

What do you think it means?

TYPES:

SHO *Simple (one restoring force) proportional to displacement from equilibrium.... Harmonic (periodic, repeats)*

Motion is like a wave..... Repeats over one : period, cycle, wave, revolution, swing, back and forth, up and down, etc...

WAVES

CIRCLE

ENERGY

DEFINITION:

AMPLITUDE *Height or Strength of wave. Distance/Angle from equilibrium to maximum. Like height of water wave, angle of swing on pendulum, loudness of sound, brightness of light.*

EQUILIBRIUM *Rest point*

PERIOD *Time per cycle (wave, swing, revolution, etc...)*

$T = \text{sec/wave}$

FREQUENCY *Cycles per time, $f = 1/T$ waves/sec... Hertz*

SPRING

Hooke's Law *$F = k X$, F is the restoring force and x is the displacement from rest. Applies to all SHM not just springs.*

Spring Constant *$k = F/x = \text{Force/Distance.... N/m}$ k is the spring constant that is dependent on the tightness, makeup of the spring.*

Pendulum:
